## ENERGY MANAGEMENT SYSTEMS FOR ENERGY COMMUNITIES

*SMARTENERGY Six pack training series*

Q. Gemine - March 16, 2021

# ENERGY COMMUNITIES

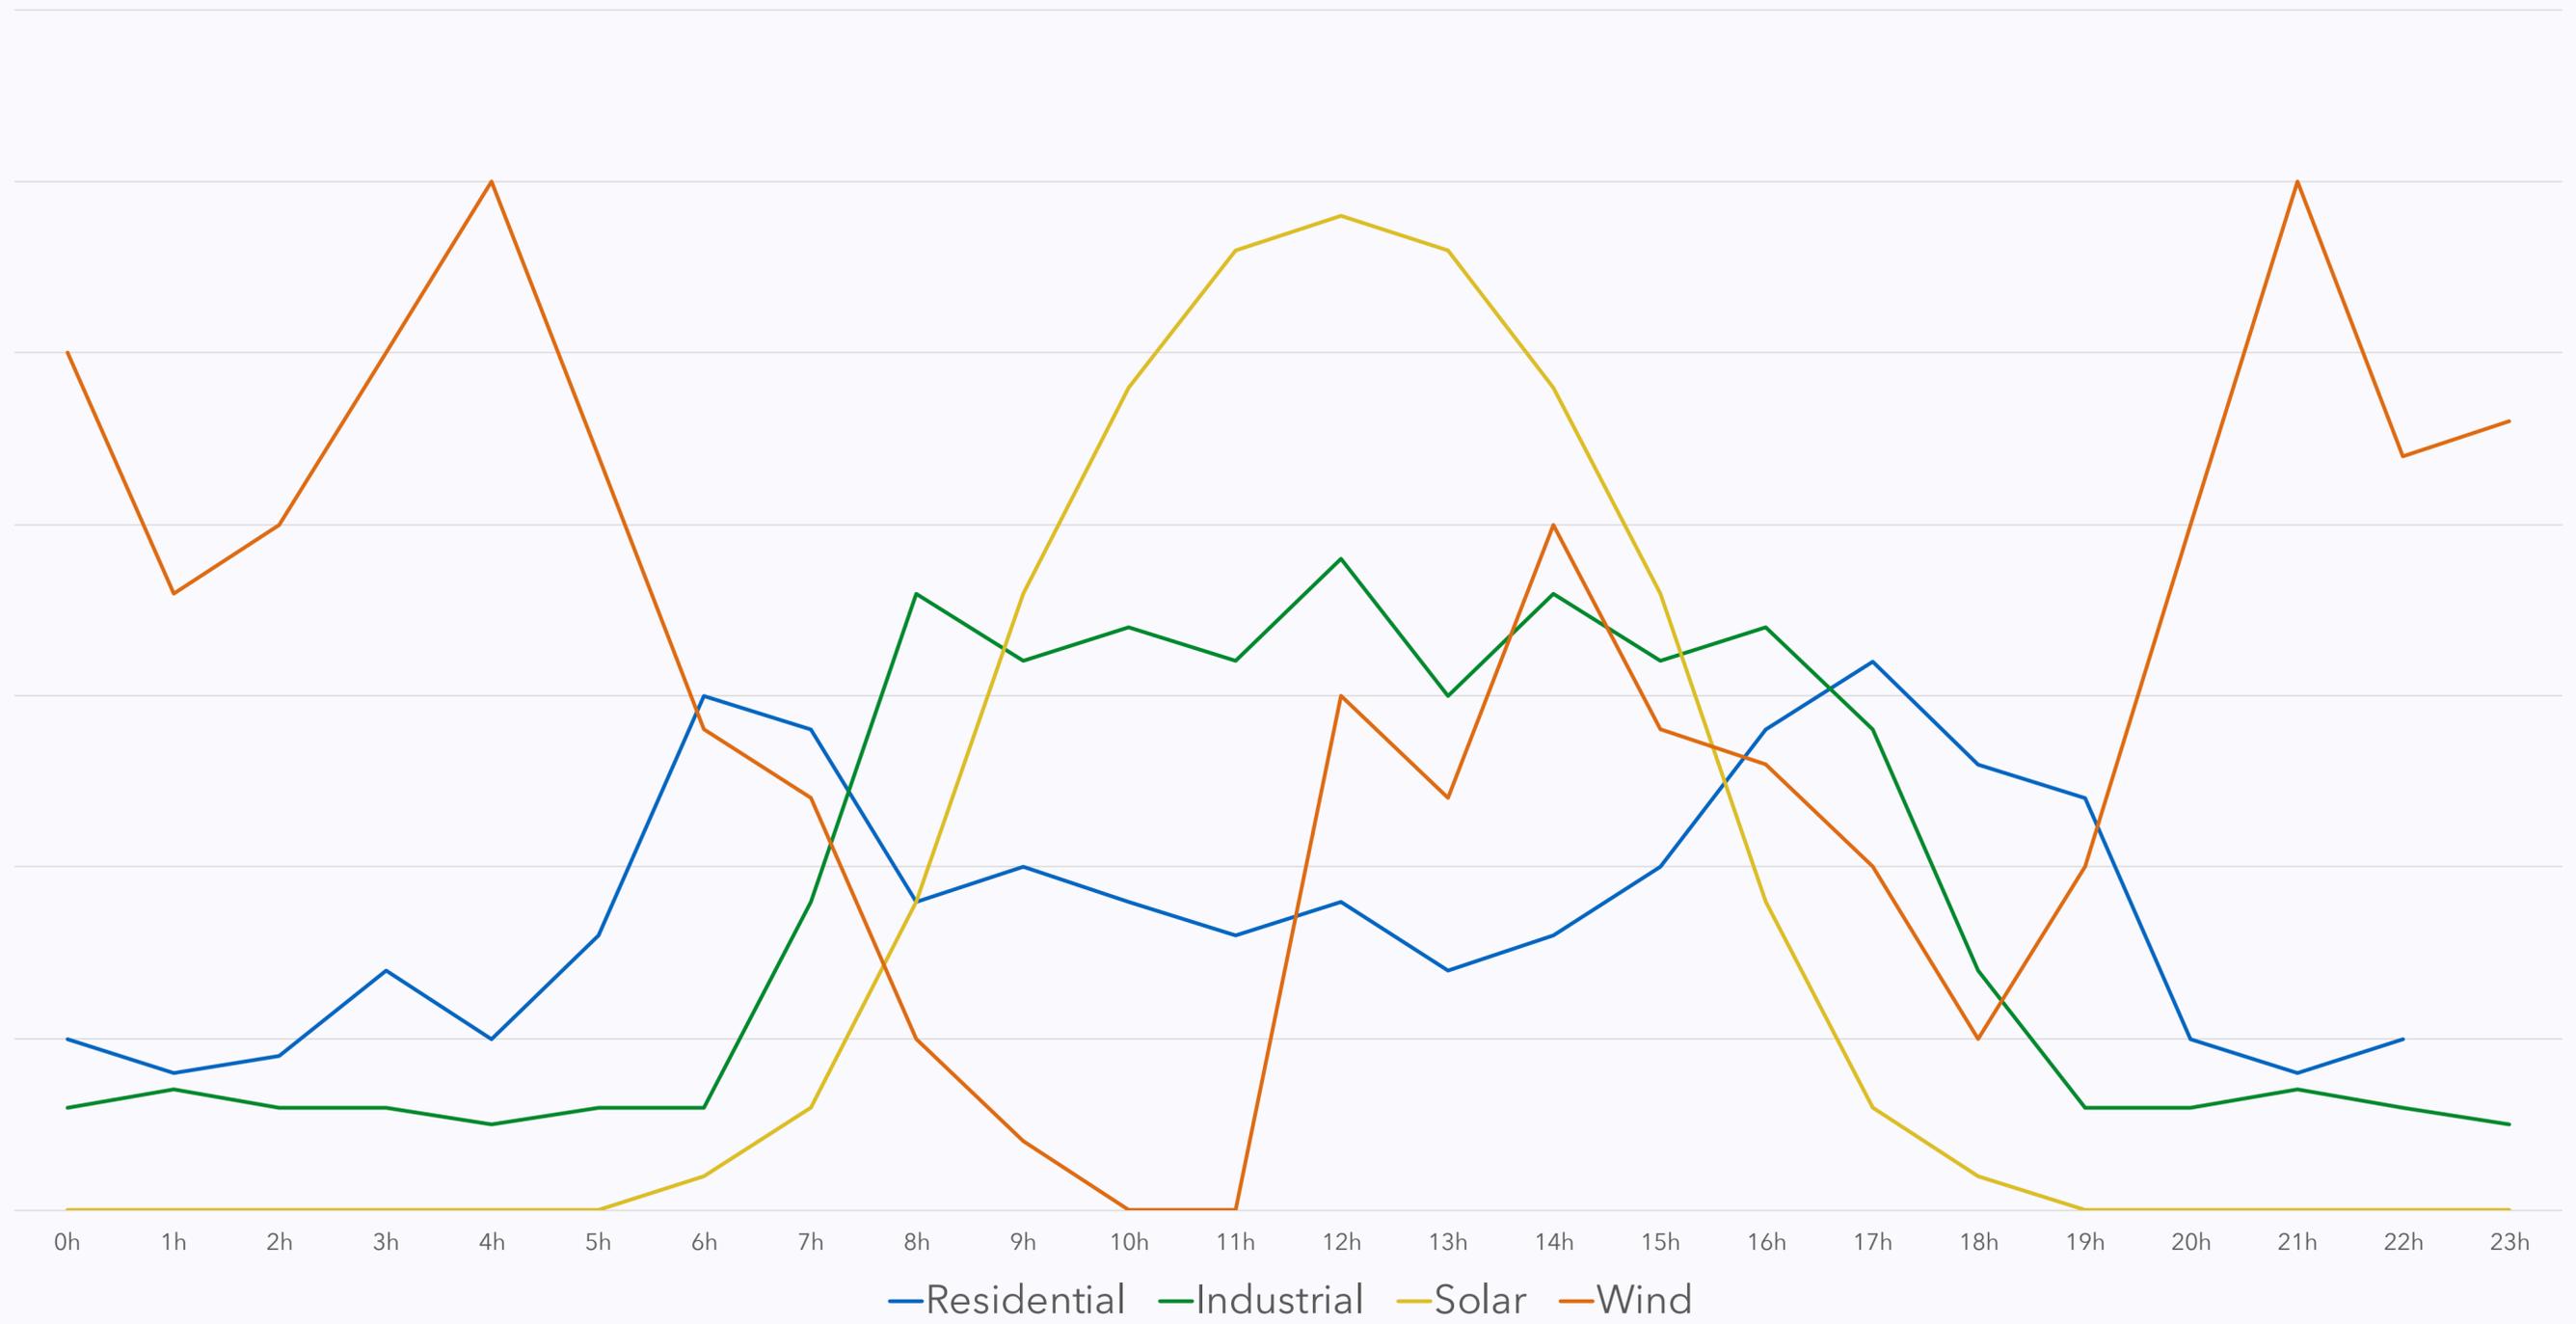

# ENERGY COMMUNITIES

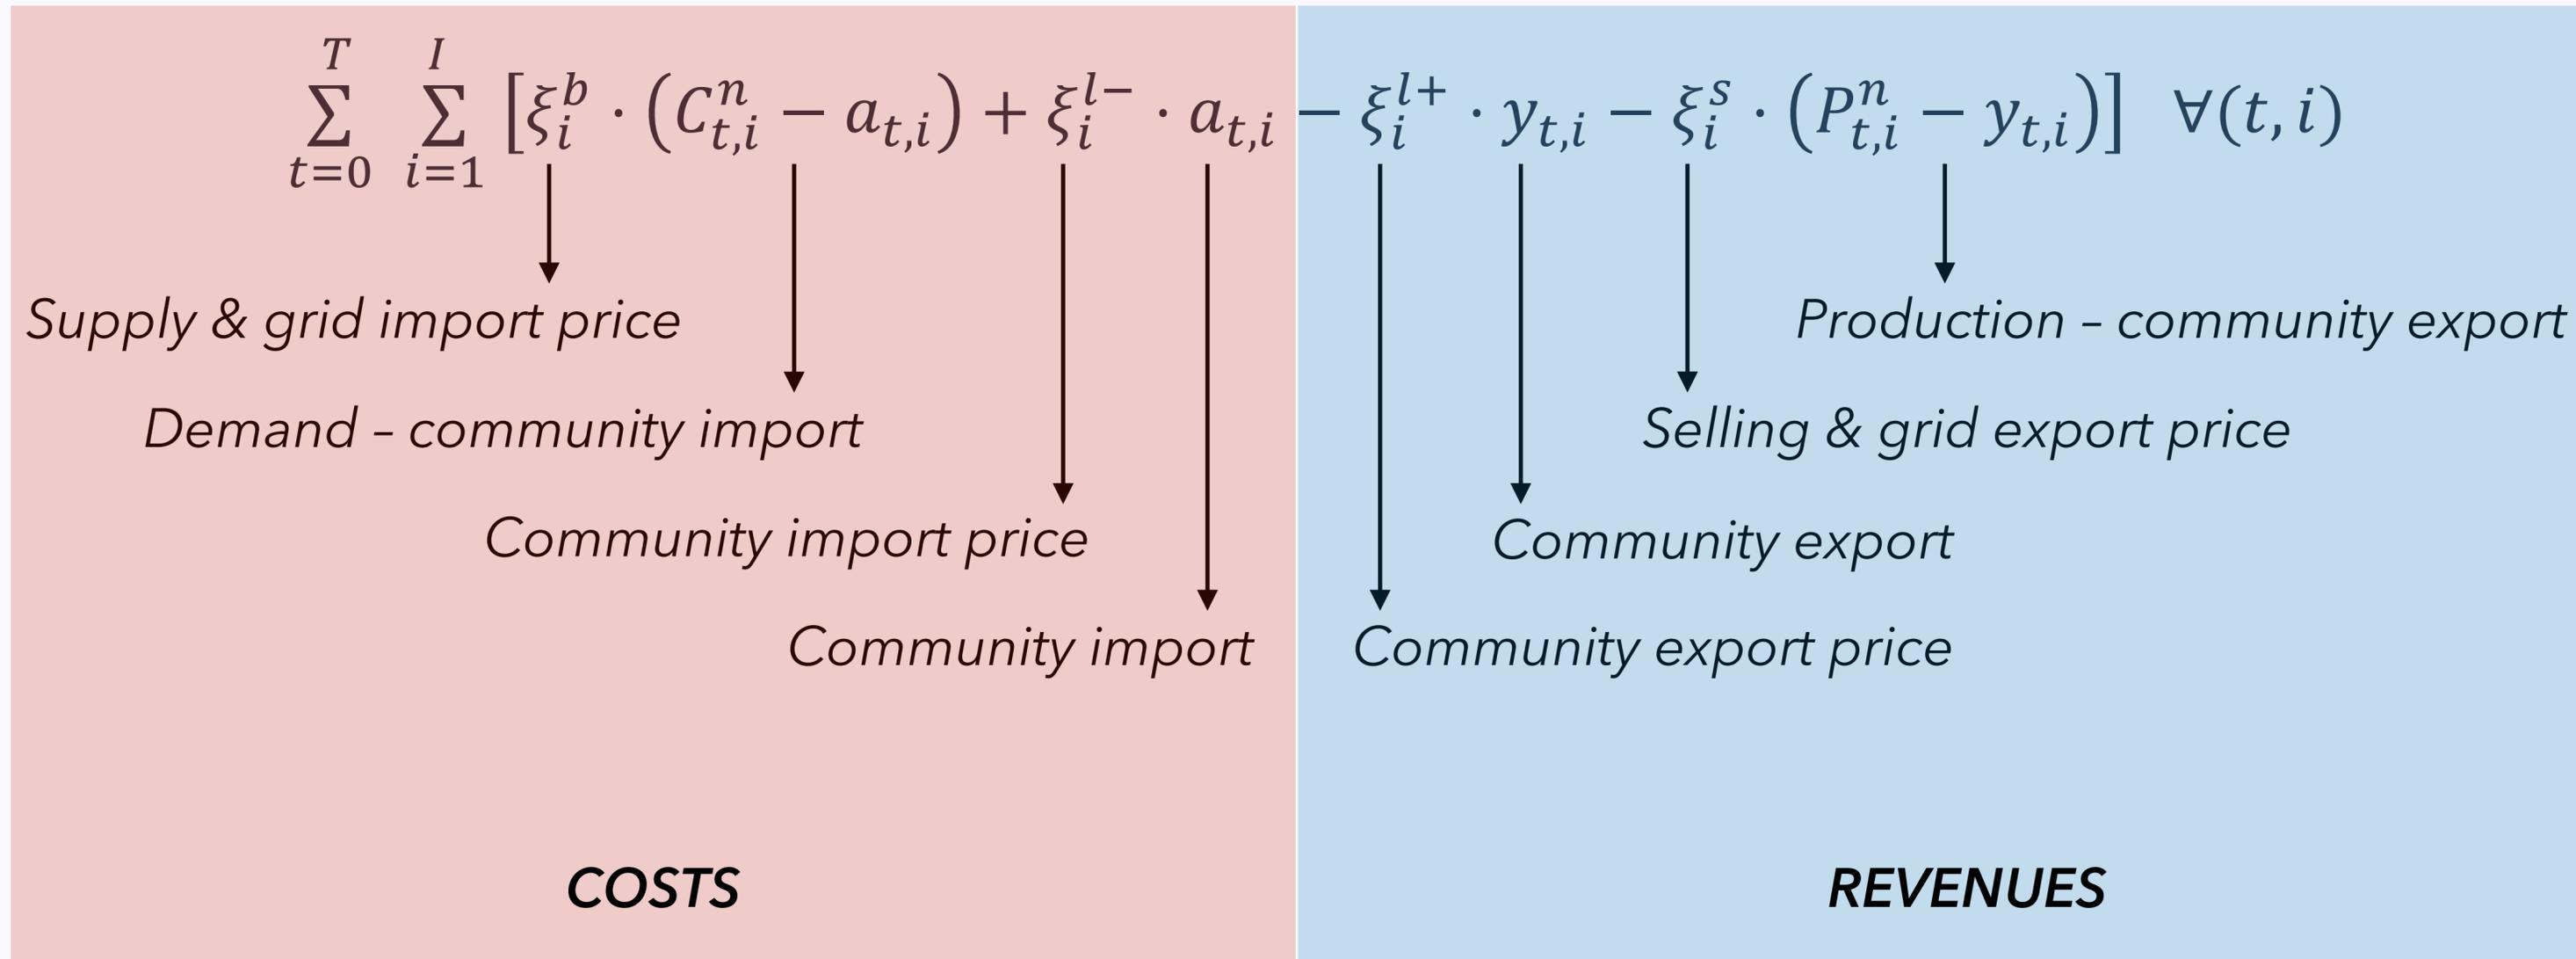

# ENERGY PROFILES

# MINIMIZE ELECTRICITY COSTS

We can formulate an optimization problem to minimize the sum of electricity costs of the community members over time :

# CONTROL MEANS - VIRTUAL

Allocation of local energy production to community members is a virtual control mean as it affects metering data instead of energy flows. These control means are:

- the share of local renewable production that is allocated to every member,
- the share of each member's production that goes to the community.

$$\sum_{t=0}^T \sum_{i=1}^I \left[ \xi_i^b \cdot (C_{t,i}^n - a_{t,i}) + \xi_i^{l-} \cdot a_{t,i} - \xi_i^{l+} \cdot y_{t,i} - \xi_i^s \cdot (P_{t,i}^n - y_{t,i}) \right] \quad \forall (t, i)$$

# OPTIMAL CONTROL

The optimization process for minimizing energy costs of community members can be performed in two steps:

- 1 ○ Plan both physical and virtual control means under uncertainty, eventually in a receding horizon approach.
- 2 ○ Run an ex-post optimization of virtual control means, once all energy flows are known with certainty.

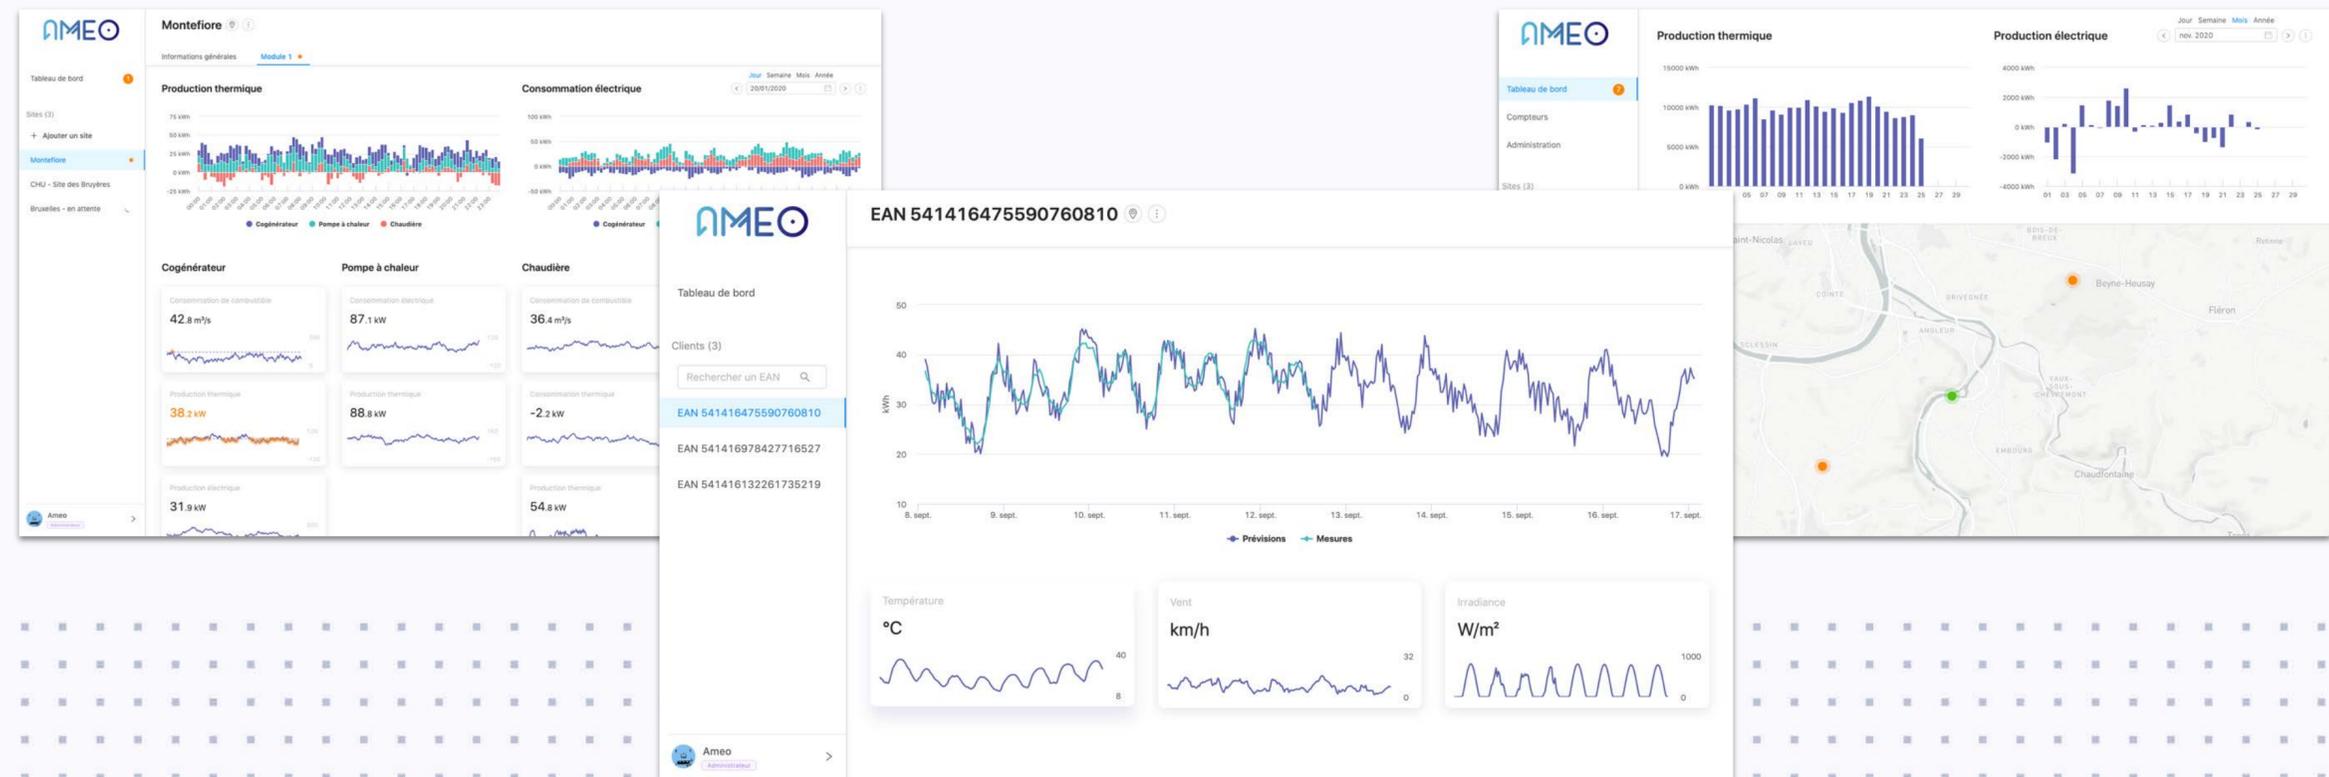

$$\sum_{t=0}^T \sum_{i=1}^I \left[ \xi_i^b \cdot \left( \cancel{C_{t,i}^n} - a_{t,i} \right) + \xi_i^{l-} \cdot a_{t,i} - \xi_i^{l+} \cdot y_{t,i} - \xi_i^s \cdot \left( \cancel{P_{t,i}^n} - y_{t,i} \right) \right] \quad \forall (t, i)$$

# AMEO

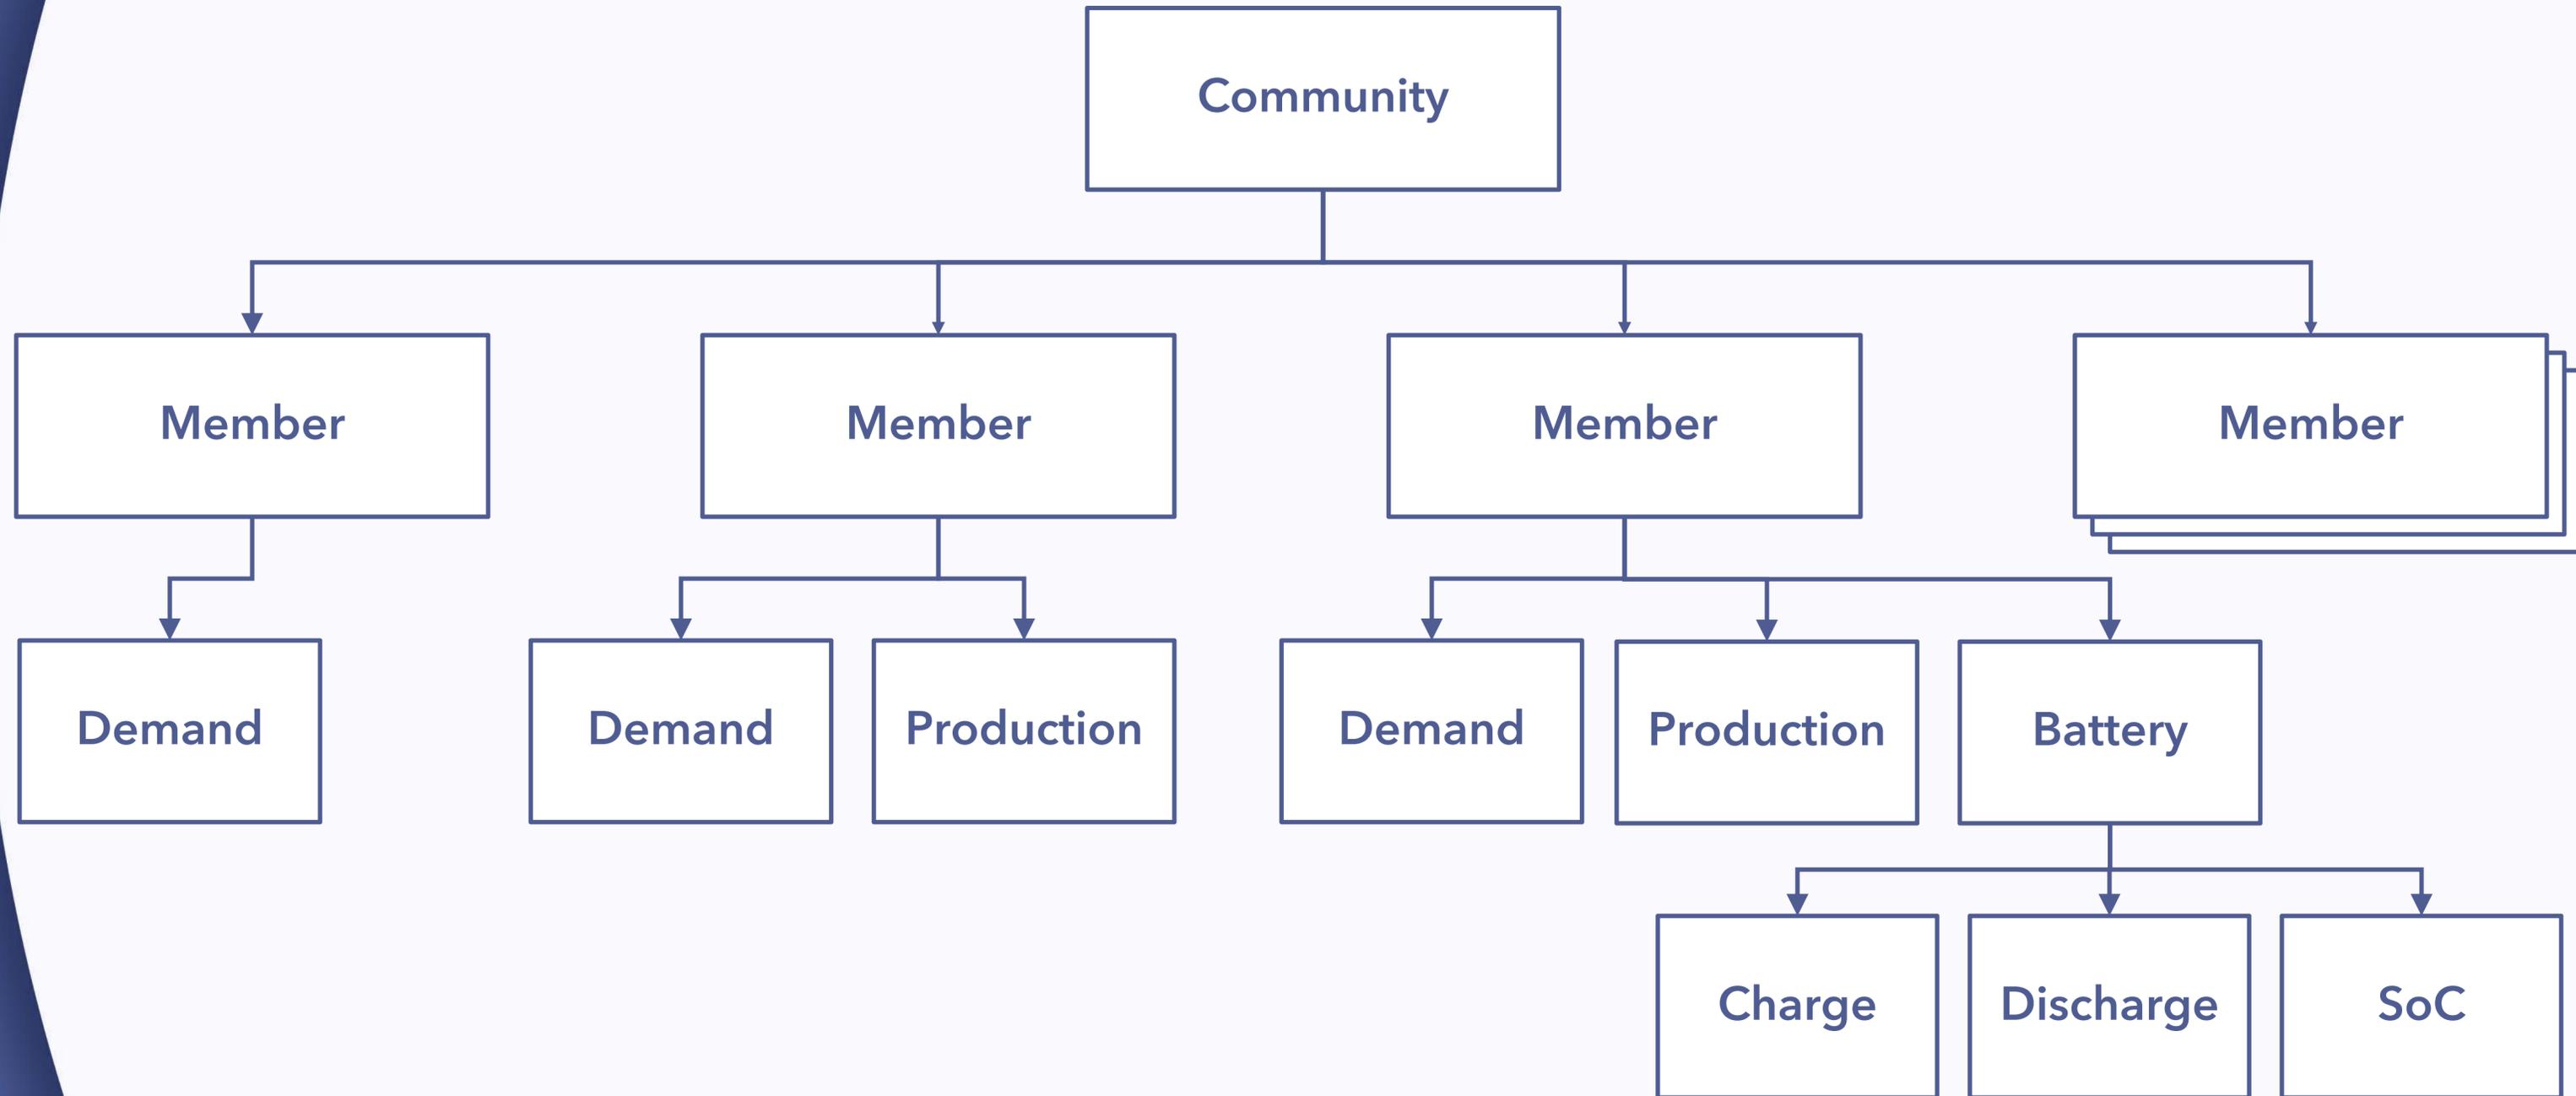

*Advanced Management of Energy Operations* is a software solution developed by Blacklight Analytics and dedicated to the advanced management of energy data and operations.

The solution collects and processes data from various sources and runs intelligent forecasting and decision-making algorithms to optimize the economic and technical operations of energy systems.
